

Part1:closures

Closures

**function along with its lexical scope
binded together to form closure**

function a()

explanation

```
function a()
```

```
var a=10
```

```
function b()
```

```
console.log(a) //10
```

Here **function b()** is lexically bound with **function a()** which means we can utilize the variables of function a() into function b()

with code

```
function a(){  
  var a=10;
```

```
  function b(){  
    console.log(a) //10  
  }  
}
```

A simple code of closures will be like above code. And why we need closures we will learn in part2

cheers in learning journey
