

- **Display:none,**
- **visibility:hidden**

interview point

@Duvvuru Kishore

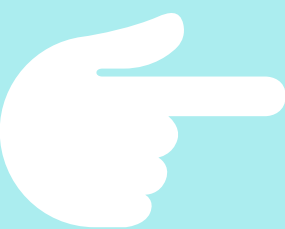

To understand the difference ,first we will take a html code . And we will apply the css styles

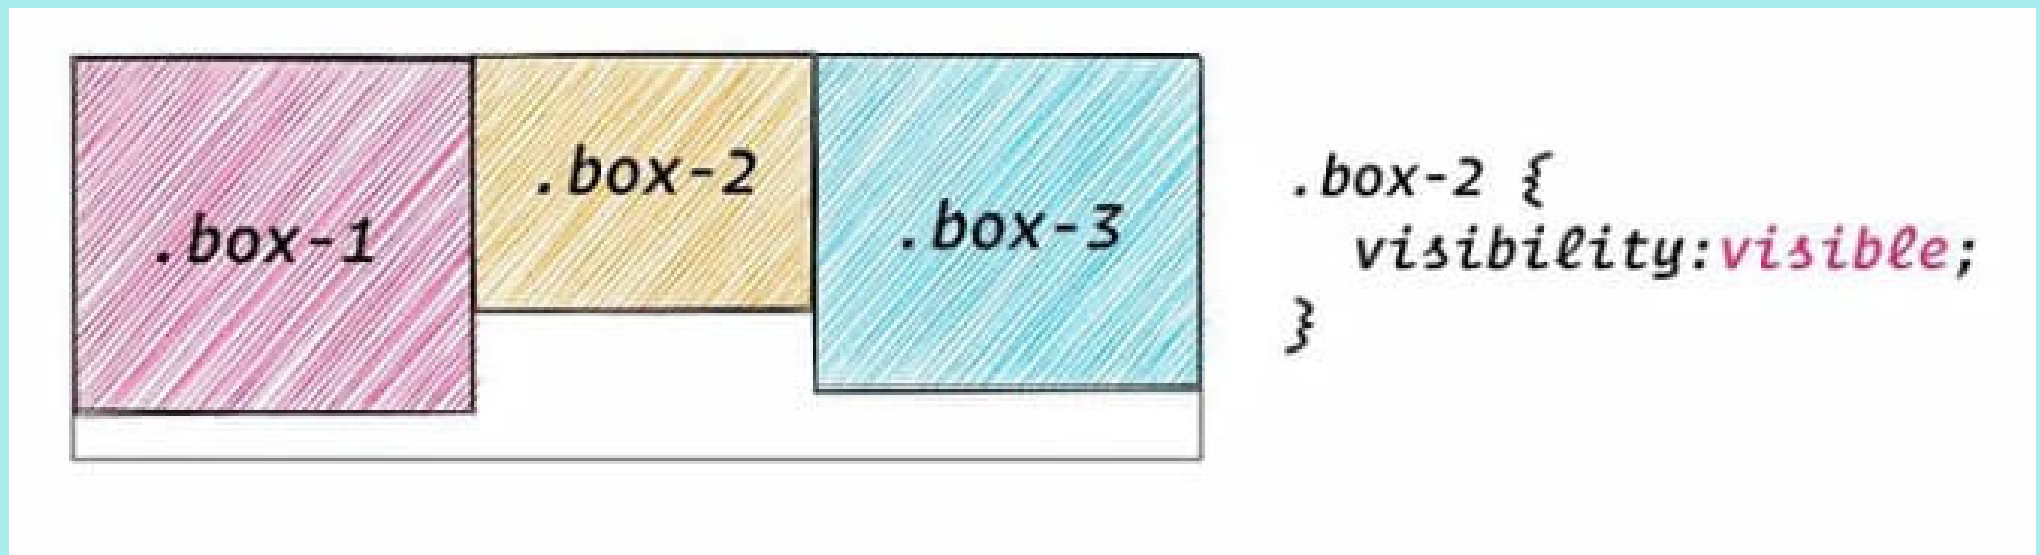

Html code:

```
<body>
  <div class="box1">Box 1</div>
  <div class="box2">Box 2</div>
  <div class="box3">Box 3</div>
</body>
</html>
```

To understand the difference of visibility :hidden and display:none. we will bring one more tag **visibility: visible**

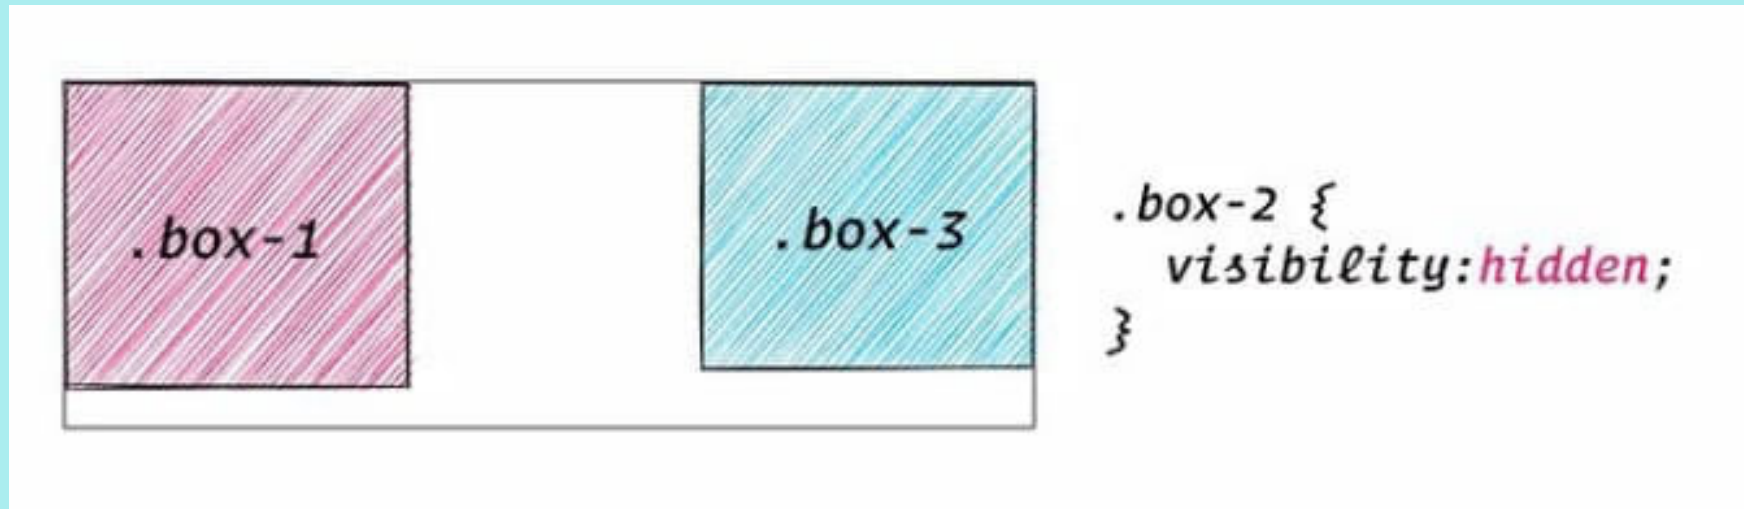

Visibility: visible

- **visibility: visible** - This is the default value. It means the element is visible and takes up space in the layout. **It's displayed as usual.**
- Even if you don't apply `visibility: visible`, the box will be displayed

Visibility:hidden

- When applied to an element, the element remains in the layout, and its space is preserved.
- The element is not visible, but it still takes up space, affecting the layout of other elements around it.

Display:none

- When applied to an element, **it removes the element from the layout entirely**. The element is not rendered on the page and does not take up any space.
- Any space that the element would have occupied is collapsed, and other elements fill in the space.
