Spread operator and Rest operator

spread operator and rest operator start with (...value). That's where we should know what to use when

Spread operator

Spread operator takes the array of parameters and spread them across the arguments in a function call

```
const arr1=[1,2,3]
const arr2=[5,6,7]
const combinedArr=[...arr1,...arr2] //[1,2,3,5,6,7]

function mySum(num1,num2,num3){
console.log(num1+num2+num3)
}

let params=[32,50,21]
mySum(...params)
```

Rest operator

If we need our function to be able to work with an unknown number of parameters ,the rest parameter comes in .

```
function multiply(...args){
return args.reduce((previous,current)=>{
return previous*current
})
}
```

```
multiply(4,2)
multiply(2,3,4)
multiply(3,6,7,8)
```
